Prostatitis (acute): antimicrobial prescribing

Background

Acute prostatitis:

- is a bacterial infection needing antibiotics
- can occur spontaneously or after medical procedures
- can last several weeks
- can lead to acute urinary retention and prostatic abscess

Self-care

- Advise paracetamol (with or without a low-dose weak opioid, such as codeine) for pain, or ibuprofen if preferred and suitable
- Advise drinking enough fluids to avoid dehydration

Antibiotics

- When prescribing antibiotics, take account of severity of symptoms, risk of complications or treatment failure, previous urine culture and susceptibility results, previous antibiotic use which may have led to resistant bacteria, and local antimicrobial resistance data
- Give oral antibiotics first-line if people can take oral medicines, and the severity of their condition does not require intravenous antibiotics
- Review intravenous antibiotics by 48 hours and consider stepping down to oral antibiotics where possible

October 2018

Prostatitis (acute): antimicrobial prescribing

Choice of antibiotic: adults aged 18 years and over

Antibiotic ¹	Dosage and course length
First choice oral antil	piotic (guided by susceptibilities when available) ²
Ciprofloxacin ³	500 mg twice a day for 14 days then review ⁴
Ofloxacin ³	200 mg twice a day for 14 days then review ⁴
Alternative first choice	ce oral antibiotic for adults unable to take a fluoroquinolone (guided by susceptibilities when available) ²
Trimethoprim	200 mg twice a day for 14 days then review ⁴
Second choice oral a	ntibiotic (after discussion with a specialist)
Levofloxacin ³	500 mg once a day for 14 days then review ⁴
Co-trimoxazole ⁵	960 mg twice a day for 14 days then review ⁴
First choice intraveno sepsis a concern ^{2,6}	Dus antibiotics (if unable to take oral antibiotics or severely unwell: guided by susceptibilities when available). Antibiotics may be combined if
Ciprofloxacin ³	400 mg twice or three times a day
Levofloxacin ³	500 mg once a day
Cefuroxime	1.5 g three or four times a day
Ceftriaxone	2 g once a day
Gentamicin	Initially 5 to 7 mg/kg once a day, subsequent doses adjusted according to serum gentamicin concentration ⁷
Amikacin	Initially 15 mg/kg once a day (maximum per dose 1.5 g once a day), subsequent doses adjusted according to serum amikacin concentration (maximum 15 g per course) ⁷
Amikacin	Initially 15 mg/kg once a day (maximum per dose 1.5 g once a day), subsequent doses adjusted according to serum amikacin concent

Second choice intravenous antibiotic - consult local microbiologist

When exercising their judgement, professionals and practitioners are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or the people using their service. It is not mandatory to apply the recommendations, and the guideline does not override the responsibility to make decisions appropriate to the circumstances of the individual, in consultation with them and their families and carers or guardian.

¹ See BNF for appropriate use and dosing in specific populations, for example, hepatic impairment and renal impairment, and administering intravenous antibiotics.

² Check previous urine culture and susceptibility results and antibiotic prescribing and choose antibiotics accordingly.

³ The European Medicines Agency's Pharmacovigilance Risk Assessment Committee has recommended restricting the use of fluoroquinolone antibiotics following a review of disabling and potentially long-lasting side effects mainly involving muscles, tendons, bones and the nervous system (press release October 2018), but they are appropriate in acute prostatitis which is a severe infection.

⁴ Review treatment after 14 days and either stop or continue for a further 14 days if needed (based on history, symptoms, clinical examination, urine and blood tests).

⁵ Only consider when there is bacteriological evidence of sensitivity and good reasons to prefer this combination to a single antibiotic (BNF, August 2018).

⁶ Review intravenous antibiotics by 48 hours and consider switching to oral antibiotics where possible for a total of 14 days, then review.

⁷Therapeutic drug monitoring and assessment of renal function is required (BNF, August 2018).
